TITLE	Research and Development in Industry, 1982. Funds, 1982; Scientists and Engineers, January 1983. Detailed Statistical Tables.
INSTITUTION	National Science Foundation, Washington, D.C. Div. of Science Resources Studies.
REPORT NO	NSF-84-325
PUB DATE	84
NOTE	67p.; Tables may be marginally legible due to small print.
AVAILABLE FROM	National Science Foundation, Washington, DC 20550 (Free).
PUB TYPE	Statistical Data (110)
EDRS PRICE	MF01/PC03 Plus Postage.
DESCRIPTORS	Costs; *Employment; Energy; Engineers; Expenditures; *Federal Aid; *Financial Support; *Industry; *Pollution; *Research and Development; Research and Development Centers; Scientists
IDENTIFIERS	National Science Foundation

ABSTRACT

Data in this report were collected by the Bureau of the Census for the National Science Foundation annual Survey of Industrial Research and Development and cover the periods 1956 to 1982 for funding data and January 1957 to January 1983 for personnel data. These data are presented in 40 tables under seven major headings: (1) total funds for research and development (R&D); (2) company funds for R&D; (3) federal funds for R&D; (4) R&D funds by size of company; (5) R&D funds related to net sales; (6) energy and pollution R&D, including: projected expenditures for energy R&D by selected industry; company and federal funds for energy R&D by selected industry (1973-1982); and industrial expenditures for pollution abatement research by industry and source of funds (1981-82), by type of pollution and source of funds (1981-82), and by type of pollution (projected, 1973-83); and (7) employment. Among the data in the last category are cost per R&D scientist or engineer by industry and size of company (1982) and total employment of R&D-performing companies by industry and size of company (1981-82). Technical notes, including survey methodology, are included. (Since this survey does not cover trade associations, data on these organizations are not provided.) (JN)

general notes

- Data in this report were collected by the Bureau of the Census (Census) for the National Science Foundation (NSF) in the annual Survey of Industrial Research and Development and cover the periods 1956-82 for funding data and January 1957-January 1983 for personnel data.
- The footnote, "Not separately available but included in total," indicates that data are being withheld either (1) to avoid disclosing the operations of an individual company; or, (2) the imputation rate—the percentage of that statistic estimated by Census—exceeds 50 percent because of the failure of some companies to supply the requested data. See table A-1 for the imputation rates of specific items.
- The industry survey does not cover trade associations. Although their primary mission is to serve industry, trade associations are established as nonprofit organizations and are covered in the NSF survey of independent nonprofit institutions. Research and development (R&D) expenditures of trade associations are estimated at less than 1 percent of the industry R&D total.
- Complete technical notes are contained in section A. Questions regarding these survey findings should be addressed to Melissa Pollak or Mary Burke, Industry Studies Group, Division of Science Resources Studies, National Science Foundation, Washington, D.C. 20550 (202) 634-3648.

section a

technical notes

scope of study

The National Science Foundation (NSF) sponsored its first survey of industrial research and development in 1953. Since then, the scope of the survey has gradually been expanded and refined in response to an increasing need for more detailed information on the Nation's research and development (R&D) effort.

The 1982 industry survey is the 26th in the annual series sponsored by NSF and conducted by the Bureau of the Census (Census), Department of Commerce. NSF also sponsored two industry surveys covering the 1953-56 period, which were conducted by the Bureau of Labor Statistics (BLS), Department of Labor.[1] Data obtained in the BLS survey are not directly comparable with the Census figures for 1957-82 because of methodological and other differences in the surveys conducted by the two agencies. In addition, beginning in 1957, the Census surveys have collected data on the R&D activities of federally funded research and development centers (FFRDC's) operated by business firms, whereas the earlier BLS surveys did not. FFRDC's are organizations administered by industrial, educational, or other institutions on a nonprofit basis; they conduct R&D activities almost exclusively for the use of the Federal Government. R&D expenditures of industry-administered FFRDC's are included in the Federal R&D data under the classifications of the administering firms. Total R&D expenditures and selected personnel data for FFRDC's are shown in table B-12. To account for the performance of these research centers in 1956, Census adjusted data for that year (collected in the 1957 survey) to provide comparable trend data for 1956 and earlier years.

Data on scientific personnel are not directly comparable with data in the surveys formerly conducted by BLS. Census uses the company, defined to include all establishments under common ownership or control, as the basic reporting unit for the survey of industrial research and development. The surveys of scientific and technical personnel conducted by BLS were on an establishment-reporting-unit basis. Further, Census obtains data on the number of R&D scientists and engineers on a full-time-equivalent (FTE) basis, unlike the BLS surveys in which data were provided in terms of scientists and engineers primarily employed in research and development.

Other variations in the two sets of data may be the result of different offices in the same company preparing the estimates or the varying response rates of the two surveys.

The statistics presented in this report are subject to response and concept errors caused by differences between survey and industry concepts and definitions of R&D activities, and by variations in company accounting procedures. Consequently, the accuracy of the data provided by respondents is subject to some variation.

Data quality has improved substantially since the first industry survey in 1953, mainly as a result of more accurate and sophisticated accounting procedures adopted by respondents. In addition, NSF and Census have endeavored to reduce response and concept errors arising from difficulties in interpreting or applying survey definitions.

NSF has been aware of the increased reporting burden placed on industry from all sources in recent years. In an effort to alleviate this burden, the detailed questionnaire (which has been in use with slight modifications since the beginning of the survey) is now mailed only biennially; an abbreviated form containing only the most crucial data elements is sent to survey respondents in the intervening years.

The shortened survey form was used for the first time to collect industrial R&D

[1] National Science Foundation, *Science and Engineering in American Industry, Final Report on a 1953-54 Survey* (NSF 56-16) and *Science and Engineering in American Industry, 1956* (NSF 59-50) (Washington, D.C.: Supt. of Documents, U.S. Government Printing Office, 1956 and 1960.)

data for 1978. Because all data elements were not collected for 1978, 1980, and 1982 some of the historical tables do not contain data for these years. The main tables affected are those which give detailed breakdowns of R&D expenditures for basic research, applied research, and development by industry and by product field. Some detailed data on energy and pollution abatement R&D activities are also deleted, as well as tables showing company-financed research and development contracted to outside organizations, Federal funds by agency, and R&D expenditures by geographic area.

survey definitions[2]

Research and development—Basic and applied research in the sciences and engineering and the design and development of prototypes and processes. This definition excludes quality control, routine product testing, market research, sales promotion, sales service, research in the social sciences or psychology, and other nontechnological activities or technical services.

Basic research—Original investigations for the advancement of scientific knowledge not having specific commercial objectives, although such investigations may be in fields of present or potential interest to the reporting company.

Applied research—Investigations directed to the discovery of new scientific knowledge having specific commercial objectives with respect to products or processes. This definition differs from that of basic research chiefly in terms of the objectives of the reporting company.

Development—Technical activities of a nonroutine nature concerned with translating research findings or other scientific knowledge into products or processes. Not included are routine technical services to customers or other activities excluded from the above definition of research and development.

Funds for research and development—Operating expenses incurred by a company in the conduct of research and development in its own laboratories or other company-owned or -operated facilities. Includes wages and salaries, materials and supplies consumed, property and other taxes, maintenance and repairs, depreciation, and an appropriate share of overhead, but excludes capital expenditures. All funds for R&D performance are expressed in current rather than in constant dollars.

Federally financed research and development—Receipts for work done by the company on Federal R&D contracts or subcontracts and R&D portions of procurement contracts and subcontracts.

Company-financed research and development—Cost of the company-sponsored research and development performed within the company. Does not include company-financed research and development contracted to outside organizations, such as research institutions, universities and colleges, or other nonprofit organizations.

R&D scientists and engineers—The January number of those engaged full time in research and development and the full-time-equivalent (FTE) of those working part time in research and development. Scientists and engineers are defined as persons engaged in scientific or engineering work at a level which requires a knowledge of physical, life, engineering, or mathematical sciences equivalent at least to that acquired through completion of a 4-year college program with a major in one of those fields.

Employment—Total number of persons domestically employed by the company in all activities during the pay period which includes the 12th of March. These data are not completely comparable with employment of R&D scientists and engineers data which are collected as of January.

Net sales and receipts—Recorded dollar values for goods sold or services rendered by a company to customers outside the company, including the Federal Government, less such items as returns, allowances, freight, charges, and excise taxes. Excludes domestic intracompany transfers as well as sales by foreign subsidiaries, but includes transfers to foreign subsidiaries and export sales to foreign companies. For companies classified in the communication equipment industry (SIC 366), manufacturing sales are included and revenues from their telecommunication activities are excluded. Net sales and receipts figures are expressed in current dollars rather than in constant dollars. All tables which include net sales figures, with the exception of table B-17, do not include data for nonmanufacturing companies.

Geographic area covered—Includes only those operations located in the 50 States and the District of Columbia.[3]

explanation of tabular data

Industry classification—Industries and industry groups shown separately in the statistical tables are classified according to their Standard Industrial Classification Manual[4] codes as follows:

- Food and kindred products (20)
- Textiles and apparel (22, 23)
- Lumber, wood products, and furniture (24, 25)
- Paper and allied products (26)
- Chemicals and allied products (28)
  - Industrial chemicals (281-82, 286)[5]
  - Drugs and medicines (283)
  - Other chemicals (284-85, 287-89)[5]
- Petroleum refining and related industries (29)[6]
- Rubber products (30)
- Stone, clay, and glass products (32)
- Primary metals (33)
  - Ferrous metals and products (331-32, 3398-99)
  - Nonferrous metals and products (333-36)
- Fabricated metal products (34)
- Machinery (35)
  - Office, computing, and accounting machines (357)
  - Other machinery, excep. electrical (351-56, 358-59)
- Electrical equipment (36)[6]
  - Radio and TV receiving equipment (365)
  - Communication equipment (366)[6]
  - Electronic components (367)
  - Other electrical equipment (361-64, 369)

[2]For more detailed information on definitions, as well as the instructions for individual items covered in the survey questionnaire, see section C.

[3]For purposes of comparison, company-sponsored research and development by foreign affiliates of U.S. domestic companies performed outside the United States is reported in table B-7 but excluded from all other tables.

[4]Executive Office of the President, Office of Management and Budget, *Standard Industrial Classification Manual, 1972* (Washington, D.C., Supt. of Documents, U.S. Government Printing Office.) Industry group code numbers are shown in parentheses.

[5]The classification "Industrial Chemicals" was revised to include SIC Group 286, Industrial Organic Chemicals. All current and historical tables were revised accordingly.

[6]Starting with the 1978 survey, oil and gas extraction (13) was no longer grouped with petroleum refining (29), and communication (48) was no longer grouped with electrical equipment (36). Instead, these SIC groups are included in the nonmanufacturing sector so that the delineation between manufacturing and nonmanufacturing industries is more consistent. This change has had almost no effect on the levels of the data.

Motor vehicles and motor vehicles equipment (371)
Other transportation equipment (373-75, 379)
Aircraft and missiles (372, 376)*
Professional and scientific instruments (38)
Scientific and mechanical measuring instruments (381-82)
Optical, surgical, photographic, and other instruments (383-87)
Other manufacturing industries—tobacco manufactures (21), printing and publishing (27), leather products (31), and miscellaneous manufacturing industries (39)
Nonmanufacturing industries—agriculture, forestry, and fisheries (07-09); mining and extraction (10-14); contract construction (15-17); transportation, communication, and other public utilities (41-49); wholesale and retail trade (50-59); finance, insurance, and real estate (60-67); and selected service industries (739, 807, 891).

Company size-class—The size of a company as determined by the total number of its employees. The five company size-classes used in this report are: less than 1,000 employees; 1,000 to 4,999 employees; 5,000 to 9,999 employees; 10,000 to 24,999 employees; and 25,000 or more employees.

Classification of reporting units—The company or corporate family which includes all establishments under common ownership or control is the basic reporting unit. Each company was similarly classified into a single size-category on the basis of its total employment.

Cost per R&D scientist or engineer—The number of R&D scientists and engineers used to estimate the cost per R&D scientist or engineer for 1957-82 is the arithmetic mean of the numbers of R&D scientists and engineers reported in each industry for January in two consecutive years. This number is then divided into total R&D expenditures in each industry. For example, the mean of the numbers of R&D scientists and engineers in January 1982 and January 1983 is divided into total 1982 R&D expenditures for a total cost per scientist or engineer in 1982.

Nonavailability of certain statistics—Tables in section B use footnotes stating "not separately available but are included in total," indicating that statistics are withheld for not meeting publication standards for the following reasons: (1) Extremely high associated sampling error of estimate; (2) high rate of imputation (over 50 percent) because of failure of companies to supply data; (3) possible disclosure of data on an individual company; or, (4) data inconsistent for inclusion in a time series. In some instances, withheld data can be derived by subtraction from higher level totals. Where this is possible, the data user should be aware that the derived numbers are statistically unreliable. In no instance, however, can any data be derived which would disclose the operations of an individual company.

Questionable data—In cases where over 50 percent of the total has been estimated the data are not published. Users should consult table A-1 for imputation rates for specific items.

Method of computation—Detailed statistics in the tables may not add to totals or subtotals because of rounding. Also, percentages were calculated on the basis of thousands of dollars and may differ from those based on the rounded figures shown.

methodology of survey[8]

The sample used for the 1982 Survey of Industrial Research and Development represents all manufacturing industries and those nonmanufacturing industries known—on the basis of earlier, more detailed samples—to conduct or to finance research and development. The sampling unit for the survey was the company, defined as a business organization consisting of one or more establishments under common ownership or control. A new panel for the R&D survey is selected approximately every five years. The newest sample was selected for the 1981 survey (the first since the 1976 survey). Approximately 11,900 manufacturing and nonmanufacturing companies are included in the current sample, which consists of about 4,500 certainty companies (those with 100-percent chance of inclusion in the panel) and about 7,000 noncertainty companies.

The basic tool for the survey is form RD-1, which is used to collect detailed R&D information. Companies in the new panel that received an RD-1 form in the old panel once again received an RD-1 form in 1981 (about 1,200 companies). The remaining certainty (about 3,300) companies and noncertainty companies (about 7,000) in the new panel received RD-1A survey forms for 1981. Form RD-1A is an abbreviated version of RD-1 and is only mailed to companies in the year in which a new sample is drawn. The purpose of form RD-1A is to canvass smaller R&D performers with a minimum of reporting burden. Once the RD-1A forms were received and tabulated from the survey respondents in 1981, they were reviewed for total R&D expenditures. Those companies which reported R&D expenditures exceeding $1,000,000 on the RD-1A form were added to the survey panel consisting of those firms that receive the RD-1 form annually. There were about 575 such companies in 1981. The remaining RD-1A companies are not mailed another form but, in subsequent years, data for them are estimated by Census based upon their 1981 reports.

The universe frame from which the latest sample panel was selected was created from two sources—the 1981 Standard Statistical Establishment List (SSEL) for single units and the 1981 Enterprise Statistics Multiunits file.

There are about 3.5 to 4 million single-unit firms in the 1981 SSEL file (including nonmanufacturing firms). There are 5.6 million multiunit companies in the 1981 Enterprise file, of which 296,146 companies have identified themselves as engaged primarily in manufacturing. All manufacturing industries and selected nonmanufacturing industries (SIC's 49, 7391, 7392, 7399, and 8911) were considered within the scope of the survey.

Companies in these industries with 500 or more employees were included in the panel with certainty. For the companies with fewer than 500 employees, a measure of size was assigned to each company based on an estimate of its total R&D expenditures. Probabilities of selection were then assigned based on the measure of size. Finally, a sample selection process

*Companies primarily engaged in the manufacture of ordnance and accessories, including complete guided missiles, are grouped with companies primarily engaged in the manufacture of aircraft and parts because of close similarity of R&D activities carried out by major companies in the two industries.

[8]This section was prepared in the Industry Division of the Bureau of the Census, the collecting and compiling agent for NSF in this survey.

gave each company an independent chance of being included in the sample.

Each year Census reviews the annual lists of R&D contractors published by the Department of Defense (DOD) and the National Aeronautics and Space Administration (NASA) to ensure that the large contractors are included in the sample. For the 1982 survey, the R&D-performing manufacturing companies from the largest DOD and NASA contractors were included in the reporting panel with certainty.

The particular sample selected is one of a large number of samples of the same type and size that, by chance, might have been selected. Estimates from each of the different samples would differ somewhat from each other, and from the results of a complete canvass conducted under essentially the same conditions as the survey. This variation among the possible estimates is defined by the sampling error, measured in standard error units. The complete canvass total would be included in the range—

1. From one standard error below to one standard error above the derived estimate for about two-thirds of all possible samples.
2. From two standard errors below to two standard errors above the derived estimate for about 95 percent of all possible samples.
3. From three standard errors below to three standard errors above the derived estimate, almost always.

An inference that the comparable complete canvass total would be within the indicated ranges would be correct in approximately the relative frequencies shown. Those proportions, therefore, may be interpreted as defining the confidence that the estimates from a particular sample would differ from complete coverage results by as much as one, two, or three standard errors, respectively.

For example, suppose an estimated total is shown as 400 with an associated relative standard error of 2 percent. Then, there is approximately 67-percent confidence that the interval 392 to 408 includes the complete canvass total, about 95-percent confidence that the interval 384 to 416 includes the complete canvass total, and almost certain confidence that the interval 376 to 424 includes the complete canvass total.

In addition to the sampling errors as measured by the standard error, the estimates are subject to errors in response, coding, processing, and imputation for nonresponse. These nonsampling errors would also occur if a complete canvass

Table A-1. Imputation rates for selected items on the research and development survey by industry: 1982

[Percent]

- Represents no imputation.

[1] These items calculated from Form RD-1 (detailed form mailed to large corporations conducting research and development) and from Form RD-1A (abbreviated version of RD-1 form mailed to smaller R&D performers). All other items calculated from Form RD-1 only; RD-1A respondents were not asked these questions.

were to be conducted under the same conditions as the survey (table A-2).

The forms for the survey were mailed in January 1983, and nonrespondents received followup letters by mail. Since total R&D performance funds, total Federal R&D funds, total net sales, and total employment are included in Census' mandatory statistical program the few companies that did not reply to form RD-1 for 1982 were mailed Census form MA-121, which collects these mandatory items.

In the absence of respondent-distributed data, Census has estimated data for items as required in accordance with past performance and industry averages. Table A-1 shows imputation rates for many survey items.

comparability of data over a period of several years

In the survey of industrial research and development, there is substantial comparability over any 2-year period. Before mailing the new survey forms each year, Census enters on each one the previous year's figures as reported by the respondent. The respondent is asked to adjust the data for the previous year as necessary to make it comparable to those data being reported for the current year. Such adjustments are made to reflect, for example, changes in reporting concepts or changes in company structure such as mergers or acquisitions. To maintain some measure of consistency, the employment-size classification of any company affected by such changes has been adjusted so that the company is tabulated in the same employment-size category for two consecutive years.

Some measure of the degree of change reflecting these adjustments in contrast to an actual change in R&D activity can be gained by comparing figures for the same year reported for two succeeding reporting periods, e.g., 1981 R&D statistics in the final report of the 1981 survey and the revised 1981 R&D statistics in the final report of the 1982 survey. The totals for broad classifications are likely to be very close in the two reports; larger differences

Table A-2. Standard error of estimate (percentage) of funds for R&D performance for all company size-groups and for companies with less than 1,000 employees by industry: 1982

Industry	SIC code	Standard error[1]	Standard error of companies with less than 1,000 employees
Total	.....	(2)	10
Food and kindred products	20	1	21
Textiles and apparel	22,23	3	22
Lumber, wood products, and furniture	24,25	2	23
Paper and allied products	26	1	16
Chemicals and allied products	28	1	9
Industrial chemicals	281-82,286	(2)	16
Drugs and medicines	283	3	15
Other chemicals	284-85,287-89	2	14
Petroleum refining and related industries	29	(2)	6
Rubber products	30	3	32
Stone, clay, and glass products	32	1	23
Primary metals	33	1	22
Ferrous metals and products	331-32,3398-99	(2)	15
Nonferrous metals and products	333-36	4	26
Fabricated metal products	34	2	18
Machinery	35	1	11
Office, computing, and accounting machines	357	(2)	15
Other machinery, except electrical	351-56,358-59	2	10
Electrical equipment	36	1	17
Radio and TV receiving equipment	365	1	20
Communication equipment	366	1	19
Electronic components	367	(2)	17
Other electrical equipment	361-64,369	2	41
Motor vehicles and motor vehicles equipment	371	(2)	14
Other transportation equipment	373-75,379	1	9
Aircraft and missiles	372,376	1	91
Professional and scientific instruments	38	2	20
Scientific and mechanical measuring instruments	381-82	4	32
Optical, surgical, photographic, and other instruments	383-87	(2)	8
Other manufacturing industries	21,27,31,39	1	13
Nonmanufacturing industries	07-17,41-67,737, 739,807,891	7	27

[1] A description of the standard error of estimate is given in section A under "Methodology of Survey." The percentage (or relative) standard errors in this table may be converted to standard errors of estimate by multiplying the percentage shown by the associated estimate. For example, the relative standard error of estimate for R&D performance for all company size groups in the paper and allied products industry (SIC 26) is shown as 1 percent, and the associated total R&D estimate for this industry is shown as $626 million in table B-2, "Funds for research and development by industry and size of company: 1982." The standard error of estimate, then, is .01 times 626 or 6.26.

[2] Less than 0.5 percent.

are noticeable in the finer detail. The results underscore the point that the measures are approximate and indicative rather than precise.

industry codes for 1967-82[9]

The industry codes appearing in the tables are based on the 1972 Standard Industrial Classification (SIC) Manual. The SIC code for individual companies for 1967-74 (which were utilized in the publications for those years) were originally determined by data reported in the 1967 Economic Censuses. The SIC codes for individual companies for 1977-79 (which were utilized in the publications for those years) were originally determined by the 1974 SSEL file. Between 1967 and 1974 and again between 1977 and 1979, the SIC code for a company on the R&D survey generally remained fixed and reflected that company's principal activity as of 1967 or 1976. Under certain circumstances, however, such as the merger of two or more companies, the acquisition of one company by another, or the formation of "conglomerates," the 1967 or 1976 SIC code for a company could have changed. Census could not be aware of a possible new SIC code for a company until the 1976 or 1981 new sample was drawn based upon the 1974 or 1981 SSEL file. (See above description of the new sample.) When the new sample was selected in each of the years 1976 and 1981, the industry codes of companies in both the old and new panels were examined for possible change. The historical R&D tables (e.g., 1968-74 and 1977-79) have been adjusted to reflect the change in company activities. As it is not known normally when a company changed its industrial activities, the data were adjusted in the following fashion: for companies changing industry codes between 1967 and 1974, the industry total for each of the years affected (1968 through 1974) were estimated to have changed at a constant rate of 14.3 percent per year. Accordingly, the data for the industry in which such a company had been classified in 1967 were deflated by 14.3 percent per year for each of the years 1968-74 (e.g., 14.3 percent subtracted in 1968, 28.6 percent in 1977, 42.9 in 1970, etc.). Similarly, the data for the industry in which such a company was classified in 1974 were inflated by 14.3 percent per year for each of the years 1968-74.

To reflect changes in industry classification between 1976 and 1981, a nonlinear algorithm was used which is intended to link the two sample years while preserving the original year-to-year industry trends as much as possible. Estimates for 1976 remained unchanged since they were based on accurate classifications of companies at that time. Revised estimates for 1980 were formed based upon prior-period data that were collected in the new 1981 sample. Thus, the revised estimates reflect the most recent classification. Based on the 1976 estimates and the revised 1980 estimates, data for each industry grouping for the years 1977, 1978, and 1979 were revised.

The following measures were adjusted in the manner just described: Number of scientists and engineers; funds for research and development—total, Federal, and company; net sales; cost per R&D scientist or engineer; and basic research expenditures. Historical data for the other categories appear in selected tables of this publication. (See tables B-2, B-5, B-7, B-9, B-18, B-19, B-24, B-25, B-26, B-30, B-34, B-35, and B-39.) No adjustments were made in data for other measures.

[9] For a discussion of industry codes for 1966 and earlier years, see National Science Foundation, *Research and Development in Industry, 1975: Funds, 1975; Scientists & Engineers, January 1976* (NSF 77-324), and *Research and Development in Industry, 1970: Funds, 1970; Scientists & Engineers, January 1971* (NSF 72-309) (Washington, D.C.: Supt. of Documents, U.S. Government Printing Office, 1978 and 1972).

section b

statistical tables

In all tables of this report

- Details may not add to totals because of rounding.
- Percentages were calculated on the basis of thousands of dollars and may differ from those based on the rounded figures shown.
- Percentage changes are increases unless otherwise indicated.

[1] Less than $0.5 million.
[2] Not separately available but included in total. See general notes.
[3] For 1957 and 1958 textiles and apparel and lumber, wood products, and furniture are included in the nonmanufacturing industries group.
[4] SIC codes 3398 and 3399 included in the nonferrous metals and products group for 1957-63.
[5] Data not tabulated at this level prior to 1972.
[6] Data not tabulated at this level prior to 1977.
[7] Included in the other electrical equipment group.
[8] Estimated by the National Science Foundation.

Table B-12. Industry-administered federally funded research and development centers--composition of work force and funds by character of work: 1981-82

[Dollars in millions]

Item	1981	1982
Total R&D funds[1]	$1,385	$1,493
Basic research	[2]137	(3)
Applied research	[2]298	(3)
Development	[2]950	(3)
	January	
	1982	1983
Full-time-equivalent R&D scientists and engineers	8,530	8,057
	March	
	1981	1982
Total employment	25,623	25,100

[1]All of these funds were devoted to Federal R&D activities.
[2]Detailed data for 1981 were estimated based upon (a) data actually reported for 1981 and (b) a revised total reported in the 1982 survey.
[3]Data not collected for 1982.

SOURCE: National Science Foundation.

Table B-13. R&D-performing companies in manufacturing and nonmanufacturing industries by size of company: 1982

Size of company (based on number of employees)	Number of companies reporting R&D funds		
	Total	Manufacturing	Nonmanufacturing
Total	13,829	([1])	([1])
Less than 1,000	[2]12,500	([1])	([1])
1,000 to 4,999	785	693	92
5,000 to 9,999	215	184	31
10,000 to 24,999	196	172	24
25,000 or more	133	121	12

[1]Not separately available but included in total. See general notes.
[2]Estimated by the Census Bureau based on the 1981 survey of companies with fewer than 1,000 employees. This figure is not comparable to estimates published in earlier volumes due to a change in the estimating procedure used to derive this number.

[1] Not separately available but included in total. See general notes.
[2] Included in other manufacturing industries group.
[3] SIC codes 3398 and 3399 included in the nonferrous metals and products group for 1957-63.
[4] Data not tabulated at this level prior to 1972.
[5] Data not tabulated at this level prior to 1977.
[6] Included in the other electrical equipment group.
[7] Separate data for companies with 5,000 or more employees and for companies with 1,000 to 4,999 employees were estimated by the National Science Foundation for 1957. Revisions of statistics by the U.S. Bureau of the Census for this year did not yield separate data for companies in these size groups.

Note: The number of R&D scientists and engineers derived by using the arithmetic mean of the full-time-equivalent of R&D scientists and engineers employed in the Januaries of two consecutive years.

[1] Not separately available but included in total. See general notes.
[2] Included in the other manufacturing group.
[3] SIC codes 3398 and 3399 included in the nonferrous metals and products group for 1957-63.
[4] Data not tabulated at this level prior to 1972.
[5] Data not tabulated at this level prior to 1977.
[6] Included in the other electrical equipment group.
[7] Estimated by the National Science Foundation.

Distribution by size of company (based on number of employees)																
Less than 1,000	.....	18	27	28	29	28	26	29	26	25	24	25	24	25	28	33
1,000 to 4,999	.....	12	19	16	18	19	17	17	17	17	17	18	18	19	21	24
5,000 to 9,999	.....			13	18	19	18	18	17	19	20	17	19	19	18	23
10,000 to 24,999	.....	25	31	31	28	16	16	16	17	18	19	20	19	20	23	25
25,000 or more	.....					31	31	33	35	34	33	34	34	34	36	39

Note: The number of R&D scientists and engineers for 1982 is derived by dividing the arithmetic mean of scientists and engineers employed in January 1982 and January 1983 by the number of company employees in all activities in March 1982. Similar procedures were used in earlier years except 1967-69 in which data were derived by dividing the worker-years of R&D scientists and engineers for the year by the March employment figures.

[1] Not separately available but included in total. See general notes.
[2] SIC codes 3398 and 3399 included in the nonferrous metals and products group for 1958-63.
[3] Data not tabulated at this level prior to the 1972 survey.
[4] Data not tabulated at this level prior to the 1977 survey.
[5] Included in the other electrical equipment group for 1958-63.

OFFICE OF THE
DIRECTOR

Dear Respondent:

The National Science Foundation requests the cooperation of your company in completing the enclosed questionnaire for the 1982 survey of industrial research and development.

This is the third time that an abbreviated version of this annual survey is being used. In 1978, the Foundation began to alternate between the complete survey form, which was sent to you last year, and a shorter version which requests companies to provide only selected data elements. The purpose of instituting this system was to reduce the reporting burden on firms, and we sincerely hope that this objective is being accomplished.

Since industry accounts for approximately 70 percent of total R&D performance in the United States, the survey is a major source of information used in evaluating scientific and technological innovation in this country. The data obtained from the survey are essential in the formulation of effective public policies which will stimulate and strengthen industry's performance of research and development. In addition, we have often been advised that individual firms find the data valuable in assessing and planning their own R&D programs.

A recent release containing key findings from last year's survey is enclosed. A more detailed report, providing substantial additional data, is expected to be available later in the spring. The Foundation will be pleased to send your firm a copy. Requests should be sent to Dr. Charles E. Falk, Director, Division of Science Resources Studies, Room L-602, National Science Foundation, Washington, D. C. 20550.

The data obtained from the survey are collected and compiled by the U.S. Bureau of the Census for the National Science Foundation. Inquiries regarding the survey should be directed to the U.S. Department of Commerce, Bureau of the Census, Washington, D. C. 20233.

Sincerely yours,

Edward Knapp

Edward A. Knapp
Director

UNITED STATES DEPARTMENT OF COMMERCE
Bureau of the Census
Washington, D.C. 20233

OFFICE OF THE DIRECTOR

FROM THE DIRECTOR
BUREAU OF THE CENSUS

We are enclosing your report form and file copy for the "Survey of Industrial Research and Development During 1982" (RD-1). We are also enclosing an instruction manual to assist you in completing the report and a letter from the National Science Foundation, which sponsors this survey, describing the importance of the survey results.

To minimize response burden, we alternate between a "long" and a "short" form every other year. The "short" version is being used for 1982. This report form is basically unchanged from the 1980 version.

Please read the instruction manual carefully, since it provides guidelines for reporting. We recognize that book records for particular items may not be maintained. In such cases, carefully prepared estimates are acceptable.

This report is authorized by law (title 13, United States Code). Items 2A and 2B and columns 2 and 4 of item 5C are part of the basic statistical program of the Bureau of the Census for manufacturing companies, and reporting of these items is mandatory. Response to the remainder of the inquiries is voluntary; however, your cooperation is needed to make the results of the survey comprehensive and accurate. By section 9 of the same law (title 13), your report to the Census Bureau is confidential. It will be seen only by sworn Census Bureau employees and used only for statistical purposes. The law also provides that copies retained in your files are immune from legal process.

Requests for copies of the resulting publication or any questions concerning this survey should be directed to Mr. William Starr of our Industry Division on (301) 763–5598. We appreciate your past cooperation in this important survey and look forward to your continued participation.

Sincerely,

Bruce Chapman

BRUCE CHAPMAN

INSTRUCTIONS FOR SURVEY OF INDUSTRIAL RESEARCH AND DEVELOPMENT DURING 1982

Outline of instructions

GENERAL Page

Information about reporting: Additional forms 1

Companies new to survey 1

Preposted figures 1

Revision of figures 2

Coverage — reported unit, period 2

Section I — GENERAL COMPANY DATA 2

Item 2 — Sales and Employment for Company 2

DEFINITION OF RESEARCH AND DEVELOPMENT 2

Section II — RESEARCH AND DEVELOPMENT PERFORMED WITHIN THE COMPANY IN THE UNITED STATES 2

Item 4 — Number of Research and Development Scientists and Engineers 2–3

Cost or Receipts for Research and Development Performed Within the Company by Source of Funds 3

Item 5 — Column 2, Federal 3–4

Item 5 — Column 3, Company and Other, Except Federal 4

Item 5C — Funds Budgeted for 1983 4

Item 6 — Research and Development by Functional Category 4

Section III — REPORTING OF RESEARCH AND DEVELOPMENT PERFORMED OUTSIDE OF COMPANY WITH COMPANY FUNDS 4

Item 7 — Total Company Funds Spent for Research and Development Activities Performed by Foreign Affiliates Outside the United States 4

GENERAL

Information About Reporting: Additional Forms — Reporting on this form may require that companies resort to the use of estimates in answering some of the questions. We are satisfied, however, that the comparability of data among companies with research and development programs is sufficient to develop meaningful totals and measures of changes from year to year.

If you require additional copies of the form, write to the Bureau of the Census, 1201 East Tenth Street, Jeffersonville, Indiana 47132. If you have any questions regarding reporting on this form, write to the Bureau of the Census, ATTN: Industry Division, Washington, D.C. 20233, or call Area Code (301) 763–5598.

Companies Reporting in Survey for the First Time — Companies not reporting in 1981 survey should fill in the figures for both years. If the company had no expenditures for research and development, complete only "Item 2." Enter "No R&D" in the space for remarks on page 2 of the form, sign and return the form.

Figures for Earlier Years are Preposted on the Form — If your company reported on form RD-1 for 1981, certain figures from that form have been copied to the present form. Please describe in the "Remarks" section (page 2 of the form) the reasons for any substantial increases or decreases in the 1982 figures entered on this form when compared to corresponding 1981 figures. Examples of such reasons are new government contracts, acquisitions and disposals, revised accounting method, etc. If you acquired or disposed of a unit performing an important amount of research and development during the 2-year period, please identify the unit in remarks, and give the total amount of research and development accounted for by such unit.

Revision of Earlier Year Figures — The 1981 figures should be revised if necessary to assure comparability with 1982 data. Please explain in remarks, any significant change in the 1981 figures. If your company did not report for 1981 or no entries have been entered in the 1981 column, fill in the figures for both years.

Report for Your Entire Company — Research and development activities for your entire domestic company should be reported, including all subsidiaries and divisions of the company. If you desire to have subsidiaries report separately, please write to the Bureau of the Census and list your subsidiaries.

Period Covered by Report — The figures reported should cover the calendar year if at all possible. However, fiscal year data are acceptable for all items except employment, provided your fiscal year ends between September and March. Please report employment figures (items 2B and 4) for the period identified in each of the items mentioned.

Section I — GENERAL COMPANY DATA

Item 2 — Sales and Employment for Company — In item 2A, report the net sales and receipts of this company and its subsidiaries to customers outside the company. (Exclude domestic intra-company transfers and sales by foreign subsidiaries, however, include transfers to such foreign subsidiaries; and export sales to foreign companies.) The reported figures should represent value f.o.b. plant after discounts and allowances and should not include freight charges; excise taxes should be excluded. In item 2B report the number of persons employed at the company in all activities in the 50 States and the District of Columbia during the pay period which includes the 12th of March 1981 and 1982. This figure would be the same as that shown by the company in item 3 of Treasury Form 941, if the company filed one form 941 for the entire company.

DEFINITION OF RESEARCH AND DEVELOPMENT

Research and development includes basic and applied research in the sciences and in engineering, and design and development of prototype products and processes. For the purposes of this questionnaire, research and development includes activities carried on by persons trained, either formally or by experience, in the physical sciences including related engineering, and the biological sciences including medicine but excluding psychology, if the purpose of such activity is to do one or more of the following things:

1. Pursue a planned search for new knowledge, whether or not the search has reference to a specific application.

2. Apply existing knowledge to problems involved in the creation of a new product or process, including work required to evaluate possible uses.

3. Apply existing knowledge to problems involved in the improvement of a present product or process.

Research and development includes the activities described above whether assigned to separate research and development organizational units of the company or carried on by company laboratories and technical groups not part of a research and development organization. We recognize that the reporting activities of such latter groups will require the use of estimates for some of the questions.

Activities to be Excluded From Research and Development — Research and development for purposes of this survey does not include quality control, routine product testing, market research, sales promotion, sales service, research in the social sciences or psychology, or other nontechnological activities or technical services.

More specifically, exclude from research and development such nontechnological activities as market research, including statistical surveys of product acceptance, estimates of market size, and studies of channels of distribution; market development, including the sale of either old or new products to obtain acceptance of them in new outlets; economic research and other research in the social sciences; and legal work in connection with patent applications and litigation and the sale or licensing of patents.

Also exclude from research and development such technical services as: quality and quantity control tests and analyses, troubleshooting in connection with breakdowns in full-scale production, including related analytical work; technical plant sanitation control; work required for minor adaptations of a specific product to meet the requirements of a specific customer, including installation and servicing in a customer's plant; engineering and other technical service furnished in accordance with agreements to licensees outside the company; aid furnished by the research and development organization to manufacturing divisions to enable them to operate in accordance with previously determined formulas, standard practice instructions, or finished product specifications; aid furnished to develop advertising programs and to promote or demonstrate new products or processes, including the cost of material furnished for trial or demonstration; assistance in preparation of speeches and publications for persons not engaged in research and development; and experimental work performed at the request of the patent division to provide information needed during the prosecution of a patent litigation.

Section II — RESEARCH AND DEVELOPMENT PERFORMED WITHIN THE COMPANY, IN THE UNITED STATES

Item 4 — Research and Development Scientists and Engineers — Scientists and engineers for this survey are defined as all persons engaged in scientific or engineering work at a level which requires a knowledge of physical or life sciences or engineering or mathematics, equivalent at least to that acquired

through completion of a four-year college course with a major in these fields, regardless of whether they held a college degree in the field.

As in the past, the figure on R&D scientists and engineers will be obtained primarily from two sources:

1. Records on the number of scientists and engineers assigned to research and development. This source is satisfactory so long as the scientists and engineers of the unit are assigned to research and development on a full-time basis (i.e, no more than 5 percent of their time is spent on nonresearch and development). For example, for company laboratories performing only research and development, report the number of scientists and engineers on the rolls in January. For other units, use source 2.

2. Figures on the proportion of total work time of scientists and engineers that is devoted to research and development. For example, if the engineering department of a manufacturing plant had 60 scientists and engineers in January 1982 and one-fourth of the scientists' and engineers' time during that month was charged to research and development projects, the figure for the number of research and development scientists and engineers included for that unit would be 15.

Cost or Receipts for Research and Development Performed Within the Company by Source of Funds — Include all costs incurred to support research and development, exclusive of capital expenditures, but including depreciation and overhead. If you perform research and development for others on contract, include the total charged for the work performed, including profit.

The relevant costs usually include but are not limited to the elements listed below:

1. Wages, salaries, and related costs. Material and supplies consumed (or purchased, if consumption figures are not available); utilities, such as telephone, telegraph, electricity, water, gas, and fuel; books and periodicals; travel and entertainment costs and professional dues.

2. Property taxes and other taxes (except income taxes) incurred on account of the research and development organization or on the facilities which the research and development organization uses. Insurance expense. Maintenance and repair, including the maintenance of buildings and grounds, depreciation on buildings, equipment, and vehicles; or rentals, if any facilities are leased.

3. Company overhead. Estimate a fair share of the cost of any functions which support research and development activities. The basis and method of estimating overhead costs will depend upon company practice. The important point is to be sure that all companies include an allowance for overhead. Items normally covered in overhead include the following:

Personnel, including personnel, medical and safety departments, and employee or industrial relations department; accounting control and fiscal (Treasurer's office); procurement and inventory, including purchasing, receiving, inspection, storage, transportation, control, and issue of materials and supplies; other services, including legal, public relations, shopwork, analytical work, plant protection, rearrangement of facilities, drafting, printing, duplicating, transportation of material and personnel, maintenance of motor vehicles, messenger service, stenographic service, and photography; salaries and related costs of research executives not on the payroll of the research and development organization.

Do not net your research and development expenditures by the amount of royalties received from either noncompany organizations or company units; or the credits received for research and development work charged or "sold" to other departments or divisions of reporting company or to outside organizations.

Types of Expense to be Excluded From Research and Development Costs — Exclude from the cost of research and development performed within the company the cost of research and development carried on for the company by noncompany research and development organizations of any kind; or fellowships, grants, and gifts to promote research and development or the study of the sciences and engineering. That part of company-held research and development contracts subcontracted to research and development organizations outside reporting company. All work that was done for your laboratories and other technical units by noncompany organizations which are not research and development organizations (for example, model construction by a noncompany model shop) is to be considered as a purchase of equipment, material, or supplies for the company research organization rather than as subcontracted research and development.

Also exclude capital expenditures, royalties paid, patent expense, income taxes, or interest. Income from sale of products manufactured in the research and development organization if these were sold to bona fide customers

Item 5 — Research and Development Performed Within the Company by Source of Funds

This item provides separate columns for reporting in 1982 the costs of research and development in Federal contracts and subcontracts, and Company and Other research and development. Definitions of "Federal," and of "Company and Other" are provided below.

Source of Funds — A separate column in item 5 is provided for each of the following:

Item 5, Column 2 — Federal — Include the cost of work done on research and development contracts or subcontracts, and research and development portions of procurement contracts and subcontracts during the year.

Do not include here, or elsewhere in the report, research and development contracts and the portions of procurement contracts that you subcontracted to other research and development organizations. To do so would cause duplication in the statistical totals derived from these reports.

Item 5, Column 3 — Company and Other — Include the cost of all company-sponsored research and development performed within the company. Research and development is performed by a few manufacturing companies for other non-Federal organizations. Such research and development should be included in this column.

In item 5C, report the expected or estimated cost of company-sponsored research and development that will be performed within the company during 1983.

Item 6 — Research and Development by Functional Category

Energy Research and Development — Include all R&D spending whose purpose is to increase energy resources or capabilities, including the development of energy equipment. Some R&D spending is for joint or multiple purposes. In these instances, estimate and report the portion of cost incurred due to the energy purpose. Energy R&D can include costs of R&D projects (both product and process) on exploration, extraction, transportation, processing, storage, generation (including conversion), distribution, conservation, etc., of present, new, or improved forms of energy. Record energy R&D spending according to type of energy.

"All other energy" includes areas such as geothermal, solar, conservation and utilization, wind, waste, hydroelectric, etc. Also include in this category, (C), the development of energy equipment which cannot be readily classified in A and B. If the energy source is waste or any other area with pollution abatement aspects, consider carefully whether one of the purposes of the project is pollution abatement.

In a limited number of cases, the separation of joint (multiple) costs which is encouraged in the preceding paragraph may not be feasible. In this circumstance, include total project cost if the primary purpose of a project is energy R&D; do not include any of project cost if the primary purpose of the project is other than energy R&D.

Pollution Abatement Research and Development — Pollution abatement R&D spending for the purpose of reducing or eliminating the emission of pollutants. As used here, abatement includes prevention, treatment, or recycling; pollution refers to the emission of pollutants to the outside of a firm's (or household's) property or activities. Do not include R&D spending to contribute to environmental aesthetics, to increase equipment durability in corrosive environments, to conserve energy (include as energy R&D) and natural resources, or to increase employee comfort, safety, and health.

There can be two types of pollution abatement R&D spending. In some cases, the only purpose of the R&D spending is pollution abatement. Examples are spending on projects to improve or design alternatives to electrostatic precipitators, wet scrubber systems, waste treatment systems, effluent monitoring devices, etc. In such cases, include the total expenditures on the R&D project. In other cases, pollution abatement is one of several purposes. Examples are spending on projects to improve production processes or products and simultaneously reduce the emission of pollutants. Pollution abatement purposes could also be combined with other types of environmental control purposes such as energy conservation or employee safety and health. In all these instances, estimate and report only the portion of cost incurred due to the pollution abatement purpose.

In a limited number of cases, the separation of joint (multiple) costs which is encouraged in the preceding paragraph may not be feasible. In this circumstance, do not include any of project cost unless the primary purpose of the project is pollution abatement. When the primary purpose is pollution abatement, include the total project cost in your answer.

Do not include any of project cost as being for pollution abatement if expected pollution abatement benefits are incidental. Incidental benefits are those obtained at no extra cost.

Section III — RESEARCH AND DEVELOPMENT PERFORMED OUTSIDE THE COMPANY — (R&D not included in Item 5)

Item 7 — Total Company Funds Spent for Research and Development Activities Performed by Foreign Affiliates Outside the United States — Report the amount of research and development financed by the U.S. parent or its foreign affiliates performed in R&D laboratories, branch plants, divisions, and subsidiaries located outside the United States.

This item excludes R&D activities performed in foreign affiliates financed by foreign governments or other outside organizations.

NOTE: Foreign affiliates are those outside the 50 States or the District of Columbia.

DUE DATE: 60 DAYS AFTER RECEIPT OF FORM — O.M.B. No. 3145-0027: Approval Expires July 31, 1984

SURVEY OF INDUSTRIAL RESEARCH AND DEVELOPMENT DURING 1982

RETURN TO Bureau of the Census
1201 East Tenth Street
Jeffersonville, Indiana 47132

Name of person who supplied 1981 data

NOTE: Data supplied in items 2A and 2B and in item 5A, columns 2 and 4, for 1982 on this form, will satisfy the mandatory reporting requirement of Census Form MA-121 (title 13, U.S. Code). Although you are not required to complete the other items, your cooperation on these voluntary items is needed to make the results of this survey comprehensive, accurate, and timely.

NOTICE – Your report to the Census Bureau is confidential by law (title 13, U.S. Code). It may be seen only by sworn Census employees and may be used only for statistical purposes. The law also provides that copies retained in your files are immune from legal process.

Item 1 – NAME AND ADDRESS OF COMPANY – *Please correct any error in name and address including ZIP code*

GENERAL INSTRUCTIONS

- Please complete and return this form in the envelope provided within 60 days. Retain the file copy for your records. This report should cover your entire company, including all subsidiaries and affiliates, unless otherwise designated.
- Enter "None" where appropriate rather than leaving a blank space.
- Reasonably accurate estimates are acceptable.
- Be sure 1981 and 1982 figures are comparable.

PLEASE READ ENCLOSED INSTRUCTIONS BEFORE COMPLETING THIS FORM

Section I – GENERAL COMPANY DATA

Item 2 – DOMESTIC SALES, RECEIPTS, AND EMPLOYMENT FOR COMPANY	CT1	1981 [1]	1982 [2]
A. Domestic net sales and receipts of this company *(Thousands of dollars)*	2001	$	$
B. Total domestic company employment in all activities during the pay period which includes the 12th of March 1981 and 1982.	2002		

Item 3 – RESEARCH AND DEVELOPMENT EXPENDITURES

Are research and development expenditures for entire domestic company, including subsidiaries and affiliates, reported on this form? . . . . . ☐ Yes ☐ No – *Please explain in remarks or on transmittal letter*

Section II – RESEARCH AND DEVELOPMENT PERFORMED WITHIN THE COMPANY IN THE UNITED STATES

(Exclude R&D financed by the company but performed by others.)

Item 4 – NUMBER OF RESEARCH AND DEVELOPMENT SCIENTISTS AND ENGINEERS *(See Instruction Manual, page 3)*	CT2	January 1982 [1]	January 1983 [2]
TOTAL →	3099		

Item 5 – COST OR RECEIPTS FOR REASERCH AND DEVELOPMENT PERFORMED WITHIN THE COMPANY BY SOURCE OF FUNDS	CT2	*Thousands of dollars*			
		1981	1982		
		TOTAL [1]	Federal funds [2]	Company and other funds except Federal [3]	TOTAL *(Sum of columns 2 and 3)* [4]
A. TOTALS →	3599	$	$	$	$
B. 1981 TOTALS →			$	$	$
C. Company and other funds, except Federal, budgeted for the year 1983 →	CT1 3800			$

U.S. DEPARTMENT OF COMMERCE
BUREAU OF THE CENSUS

COMPANY SUMMARY OF RESEARCH AND DEVELOPMENT

1982

RETURN TO: Bureau of the Census
ATTN: Industry Division
Washington, D.C. 20233

Please complete and return this form in the return envelope not later than 15 days after you receive it. Companies with no research and development expenditures should so state in the "Remarks" section, fill in items 1a and 1b, sign, and return the form.

NOTICE – Response to this inquiry is required by law (title 13, U.S. Code, sections 131, 182, 224, and 225). By section 9 of the same law, your report to the Census Bureau is confidential. It may be seen only by sworn Census employees and may be used only for statistical purposes: The law also provides that copies retained in your files are immune from legal process.

(Please correct any error in name and address including ZIP code)

▶ GENERAL INSTRUCTIONS

A report should be filed by each company receiving a copy of this form. If your company does not conduct research and development, so state in remarks, fill in items 1a and 1b, sign, and return the form. If you have questions regarding reporting problems on this form, please write to the Bureau of the Census, Industry Division, Washington, D.C. 20233.

Report for your entire company – Research and development activities for your entire domestic company should be reported.

Period covered by report – The cost figure reported should cover the calendar year if at all possible. However, fiscal year data are acceptable, provided your fiscal year ends between September and March.

▶ DEFINITION OF RESEARCH AND DEVELOPMENT

Research-development includes basic and applied research in the sciences (including medicine) and in engineering, and design and development of prototypes, products, and processes. It does not include quality control, routine product testing, market research, sales promotion, sales service, research in the social sciences or psychology, or other nontechnological activities or technical services.

▶ SPECIFIC INSTRUCTIONS BY ITEM

Item 1 – Sales and Employment for Company. In item 1a, report the net billings of this company and its subsidiaries to customers outside the company. (Exclude domestic intra-company transfers and sales by foreign subsidiaries. Include the transfers to such foreign subsidiaries, however.) In item 1b, report the number of persons employed by the company in all activities in the 50 States and the District of Columbia during the pay period which includes the 12th of March 1982.

This figure would be the same as that shown by the company in item 1 of Treasury Form 941, if the company filed one form 941 for the entire company.

Item 2 – Show all costs incurred within the company for wages and salaries, direct material costs, services and supporting costs, and an appropriate share of company overhead to conduct research and development activities.

Under Federal funds, include research and development in procurement as well as research and development contracts and research and development subcontracts. Exclude research and development subcontracted to others.
